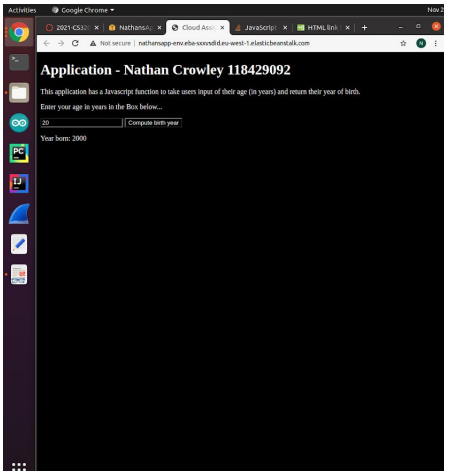
Nathan Crowley 118429092

My application:

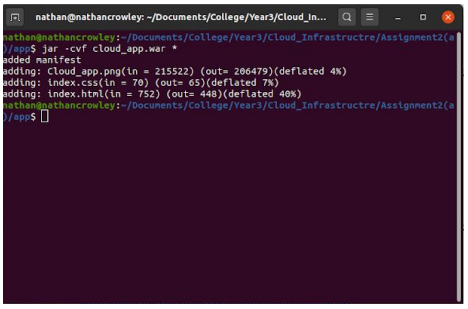
My html file has a javascript function that takes in user input of their age in years and calculates the year they were born. The answer is then shown in a paragraph tag below the javascript input box.

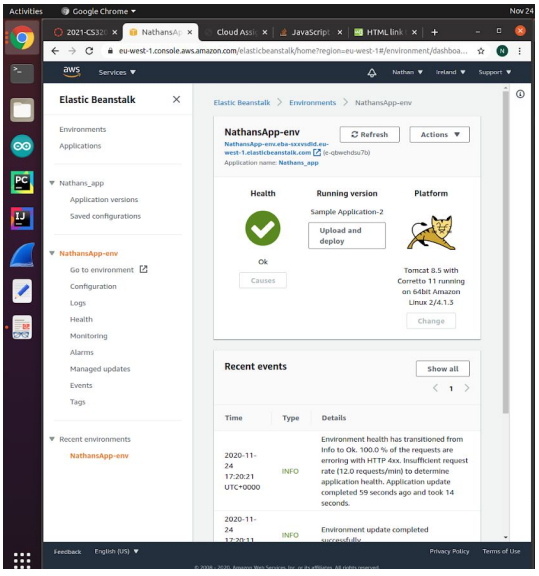
This is my application running on AWS elastic beanstalk.



Uploading my web application:

To upload my application, directory with a html file as well as a css file, I created a **war file** of this directory by the terminal command **jar -cvf cloud_app.war ***.





This is what I **Upload and deploy** to the AWS environment.
