## My Application:

Users enter an identifier, which will be used as the primary key in the database. Then users enter their age in years and the application outputs the year they were born.

I can store the users **id**, **age** and **year born** data in my SQL database.

## Creating SQL database hosted on AWS:

I have my database identified as "cloud-2b-db" with:

**endpoint** = "cloud-2b-db.cz1l4nxz6etf.eu-west-1.rds.amazonaws.com"

**port** = "3306".

## SQL code to store application data:
